The Trac Timeline

The timeline provides a historic view of the project in a single report.

It lists all Trac events that have occurred in chronological order, a brief description of each event and if applicable, the person responsible for the change.

The timeline lists these kinds of events:

- **Wiki page events** -- Creation and changes
- **Ticket events** -- Creation and resolution/closing (and optionally other changes)
- **Source code changes** -- Repository check-ins
- **Milestone** -- Milestone completed

Each event entry provides a hyperlink to the specific event in question, as well as a brief excerpt of the actual comment or text, if available.

See TracIni for timeline configuration options.

RSS Support

The Timeline module supports subscription using RSS 2.0 syndication. To subscribe to project events, click the orange **XML** icon at the bottom of the page. See TracRss for more information on RSS support in Trac.
