Wiki Page Names

Wiki page names commonly use the [CamelCase](#) convention. Within wiki text, any word in [CamelCase](#) automatically becomes a hyperlink to the wiki page with that name.

[CamelCase](#) page names must follow these rules:

1. The name must consist of **alphabetic characters only**. No digits, spaces, punctuation, or underscores are allowed.
2. A name must have at least two capital letters.
3. The first character must be capitalized.
4. Every capital letter must be followed by one or more lower-case letters.
5. The use of slash (/) is permitted in page names (possibly representing a hierarchy).

If you want to create a wiki page that doesn't follow [CamelCase](#) rules you can use the following syntax:

```
* [wiki:Wiki_page], [wiki:ISO9000]
* [wiki:"Space Matters"] that page name embeds space characters
* or simply: ["WikiPageName?s (!MoinMoin's internal free links style)
```

This will be rendered as:

- [Wiki_page?. ISO9000?](#)
- [Space Matters?](#) that page name embeds space characters
- or simply: [WikiPageName?s](#) (MoinMoin's internal free links style)

Starting with Trac 0.11, it's also possible to link to a specific *version* of a Wiki page, as you would do for a specific version of a file, for example: [WikiStart@1](#).

See also [TracLinks#QuotingSpaceinTracLinks](#).

Finally, and as exemplified in the line above, one can also append an anchor to a Wiki page name, in order to link to a specific section within that page. The anchor can easily be seen by hovering the mouse over a section heading, then clicking on the ¶ sign that appears at its end. The anchor is usually generated automatically, but it's also possible to specify it explicitly: see [WikiFormatting#using-explicit-id-in-heading](#).
